

Upwork Client Loyalz QA Bug Report

Application	Loyalz Mobile App
Test Date	22/04/2026
Tested By	Nilava Pal
Total Count	3
Blocker Count	0
Critical Count	1

Bug Summary:

Bug Id	Bug Summary
Bug_001	Incorrect phone number displayed on OTP verification screen
Bug_002	OTP verification bypass allows password reset with invalid OTP
Bug_003	Back navigation exits the application instead of returning to the previous screen

Bug ID: Bug_001

Title: Incorrect phone number displayed on OTP verification screen during password reset

Module: Forgot Password (OTP flow)

Description: During the Forgot Password flow, the OTP is successfully delivered to the entered phone number. However, the OTP verification screen displays a different (incorrect) masked phone number. This creates a mismatch between the actual OTP recipient and the number shown in the UI, leading to user confusion.

Environment: DEV

Platform: Android

Device Model: OnePlus 10 Pro 5G

Build Version: NA

OS Version: Android 16.0.3 (OxygenOS)

Test Scope: Exploratory Testing

APP: Loyalz Mobile App

Severity (Critical/High/Medium/Low): Medium

Priority (High/Medium/Low): High

Frequency (Always/Sometimes/Rare): Always

Precondition:

1. The user should be on the Forgot Password screen
2. User should have/enter a valid phone number
3. Internet connection should be active

Steps to Reproduce:

1. Open the app (Loyalz)
2. Navigate to Forgot Password
3. Enter a phone number
4. Tap on Send OTP
5. Observe the OTP verification screen

Actual Result:

- OTP is successfully received on the entered phone number via flash message
- However, the OTP verification screen displays a different (incorrect) masked phone number (e.g., +987*** **10)
- This creates a mismatch between the actual OTP recipient and the number shown in the UI

Expected Result:

- OTP should be sent to the phone number entered by the user
- The OTP verification screen should display the same (correct) masked phone number corresponding to the entered number
- There should be no mismatch between the entered number and the displayed number

Impact:

- ❖ Confuses OTP verification
- ❖ Reduces user trust in the application
- ❖ May lead users to believe OTP was sent to the wrong number
- ❖ Can result in unnecessary retries or drop-offs

Recommendation (Optional):

- Ensure the entered number is passed correctly to the OTP API
- Sync frontend input with backend request
- If only registered number is allowed → disable editing & show message

Evidence / Screenshot:

Screenshot 1: Entered phone number

Screenshot 2: OTP sent to different number

Reported By: Nilava Pal (QA Automation Engineer)

Bug ID: Bug_002

Title: OTP verification bypass allows password reset with invalid OTP

Module: Forgot Password (OTP flow)

Description: During the Forgot Password flow, the application allows users to proceed to the password reset screen without validating the entered OTP. Even when an incorrect or random OTP (e.g., 123456) is entered, the system navigates to the "Change Password" section and allows the password to be updated successfully. This indicates that OTP verification is not being enforced, leading to an authentication bypass.

Environment: DEV

Platform: Android

Device Model: OnePlus 10 Pro 5G

Build Version: NA

OS Version: Android 16.0.3 (OxygenOS)

Test Scope: Exploratory Testing

APP: Loyalz Mobile App

Severity (Critical/High/Medium/Low): Critical

Priority (High/Medium/Low): High

Frequency (Always/Sometimes/Rare): Always

Precondition:

4. User should be on the Forgot Password screen
5. User should have/enter a valid phone number
6. Internet connection should be active

Steps to Reproduce:

1. Open the app (Loyalz)
2. Navigate to **Forgot Password**
3. Enter a registered phone number
4. Tap on Send OTP
5. OTP is flashing out

6. Ignore or cancel the received OTP (do not use correct OTP)
7. Enter a random OTP (e.g., 123456)
8. Tap on **Verify**
9. Observe navigation to Change Password screen
10. Enter a new password and submit

Actual Result:

- User is able to proceed to the password reset screen without entering a valid OTP
- System accepts invalid/random OTP values
- Password is successfully changed without proper OTP verification

Expected Result:

- System should validate the entered OTP against the generated OTP
- User should not be allowed to proceed with invalid or incorrect OTP
- Password reset should only be allowed after successful OTP verification

Impact:

- ❖ Allows unauthorized users to reset account passwords.
- ❖ Leads to potential account takeover.
- ❖ Compromises authentication mechanism.
- ❖ High risk to user data security and privacy.

Recommendation (Optional):

- Enforce strict OTP validation on the backend
- Do not allow navigation to password reset screen without successful OTP verification
- Implement server-side validation for OTP before allowing password change
- Add error handling for invalid OTP inputs
- Log and monitor failed OTP attempts

Evidence / Screenshot:

Screenshot 1: Entered phone number

Screenshot 2: Flash message

Screenshot 3: Wrong OTP provided

Screenshot 4: Accepting Wrong OTP

Reported By: Nilava Pal (QA Automation Engineer)

Bug ID: Bug_003

Title: Back navigation exits the application instead of returning to the previous screen

Module: Connect with partner

Description: While navigating from the Connect With Partner screen, tapping the back button does not return the user to the previous screen (such as Dashboard or Memories). Instead, the application exits completely.

Environment: DEV

Platform: Android

Device Model: OnePlus 10 Pro 5G

Build Version: NA

OS Version: Android 16.0.3 (OxygenOS)

Test Scope: Exploratory Testing

APP: Loyalz Mobile App

Severity (Critical/High/Medium/Low): Medium

Priority (High/Medium/Low): High

Frequency (Always/Sometimes/Rare): Always

Precondition:

7. User should be logged into the application
8. User should navigate to "Connect With Partner" screen

Steps to Reproduce:

1. Open the app (Loyalz)
2. Provide credential
3. Click on Sign In button
4. Application navigating to Connect with Partner screen

Actual Result:

- On pressing the back button, the app closes and returns to the device home screen.

Expected Result:

- The back button should navigate the user to the previous screen (e.g., Dashboard or Memories page) instead of exiting the application.

Impact:

- ❖ Poor user experience due to unexpected app exit.
- ❖ Breaks standard navigation flow.
- ❖ May confuse users and lead to frustration.
